Qiskit

RECOMMENDED FOR YOU

Based on your background, here's the fastest way to get started with quantum computing on qBraid. No prior experience needed — just follow along.

Your First Quantum Circuit

Run a quantum program on a simulator and a real QPU — no physics knowledge needed.

5 min

<> Notebook

Platform Overview Tour

Interactive walkthrough of environments, devices, and jobs.

3 min

🔗 Interactive

Browse Available Devices

See every simulator and QPU you can target from the qBraid SDK — no credentials required.

5 min

<> Notebook

📌 TOURS 1

Interactive in-app walkthroughs that point at real buttons in the UI.

📌 Platform Overview Tour

Interactive walkthrough of environments, devices, and jobs.

3 min▶

📌 NOTEBOOKS 3

Notebooks you can open and run immediately — qbraid, qiskit, and braket are pre-installed.

Qiskit

 RECOMMENDED FOR YOU

Set up your IBM credentials, install the QGSS 2026 environment, and start with the Lab 0 warm-up — then continue with the labs below.

Set Up Vault + Submit to IBM (Tour)

Add your IBM Quantum token to qBraid Vault and submit a GHZ circuit on the stock Python 3 kernel. No env install needed.

5 min

 Interactive

Install Qiskit Env + Submit to IBM (Tour)

The longer path — install the dedicated Qiskit environment, configure IBM credentials, and submit a 4-qubit GHZ circuit.

10 min

 Interactive

Lab 0: Welcome to QGSS 2026

Your warm-up notebook — check your setup, run Sampler and Estimator exercises, and build your first multi-qubit circuit.

30 min

Notebook

VIDEO TUTORIALS

4

Lessons from IBM Quantum's 'Use a Quantum Computer Today' course.

Lesson 1: Build and Run Your First Quantum Program

Run a real Qiskit program against IBM Quantum hardware end-to-end.

18 min

Lesson 2: Quantum Mechanics Basics

Python 3 (ipykernel)

Lab 0: Welcome to the Qiskit Global Summer School 2026

If you can read this first line, it means you've successfully joined the event on On24 — great work! This is Lab 0, your warm-up notebook to get you ready for the main event. In this lab, you will:

- Upgrade your Python packages
- Complete simple coding exercises with Sampler and Estimator
- Build a special multi-qubit quantum circuit and explore its statevector
- *(Optional)* Build a quantum circuit in C using the Qiskit C API

Excited? There's plenty more ahead!

This lab runs on macOS, Linux, and cloud platforms like [qBraid](#) and [Google Colab](#). If you're on Windows, we recommend using a cloud platform for the best experience, especially for the upcoming labs where some packages work best in Linux-based environments.

Here's a quick summary:

YOUR OS	HOW TO RUN THIS LAB
macOS / Linux	Run locally — the notebook handles setup for you.
Windows	Chapters 1–2 run locally with Python and <code>venv</code> . For the optional chapter 3, open this notebook on qBraid or Google Colab .

Installation

Run this cell first to check your Python version
